Delivering Value Through Personalized Medicine: An Industry Perspective

Josephine A. Sollano, Dr.PH Head, Global HEOR and Medical Communications Pfizer Oncology, NY, USA josephine.sollano@pfizer.com

What is Personalized Medicine?

- Tailoring of medical treatment to the individual characteristics of each patient
- Ability to classify individuals into subpopulations based on susceptibility to a disease or response to a treatment
- Preventive or therapeutic interventions are concentrated on those who will benefit, sparing expense and side effects for those who will not

What Are We Trying to Accomplish?

Delivering the right treatment, to the right patient, at the right time

The Impact of Personalized Medicine

Benefit to Clinical Development

More Efficient Trial Design + Improved Efficacy of Medicines Developed ➡ Smaller, more efficient Ph 3 Trials

Benefit to Patients

More Dramatic Effect in Treated Patients ➡ Clear Value of Treatment

Everyone Benefits

Industry

Pharmaceutical Manufacturer

- Keener ability to identify patients most likely to respond
- Increased productive and efficient drug development

Diagnostic Developer

- · Increased opportunity to innovate
- Greater acceptance and use of diagnostic testing within medical community

Regulatory Agencies

- With narrower, better defined patient populations, there may be an enhanced ability to protect patient's health, ensure safety, quality and efficacy of health products
- More specific information about medicines to help balance the benefit risk profile
- Increased assurance that patients most likely to benefit from a treatment will be those to receive it

Four Ps

Patients

- Provides directed care with optimal therapies
- Receive most appropriate therapy early in their disease process

Payors

- Provides clear evidence for which to base reimbursement decisions
- Avoids unnecessary costs

Physicians

- Enables the prescribing of therapies to pts most likely to benefit
- Reduces trial-and-error prescribing

Policymakers

 Increased ability to formulate policy to benefit specific populations

Our Personalized Medicine Approach

- Scientific research and clinical development have **advanced significantly in recent decades**; we now have a deeper understanding of several diseases at a far deeper biological and molecular level.....
 - 30 years ago, lung cancer was divided into small-cell and non-small cell cancer
 - **Today,** we understand it to be a group of heterogeneous diseases with different molecular origins
- Pfizer has recognized the potential of this **new way of** thinking—our R&D efforts now focus on:
 - Identifying molecules that block genetic biomarkers driving certain diseasesand shifting focus from a one-size-fits-all approach
 - Delivering medicines and vaccines in a more tailored and targeted approach

Our Goal

To develop therapies with greater safety and efficacy that will be approved for smaller, welldefined patient populations and will ultimately impact disease and improve patient outcomes

XALKORI: Timeline from Compound Identification, Target Discovery and Clinical Results

¹ Soda M, Choi YL, Enomoto M, et al. *Nature*. 2007;448(7153):561-566.

Evidence Development within a New Drug Development Paradigm for Payors and Other Stakeholders

- Understanding the unmet need

 Molecular epidemiology studies, chart reviews, natural history studies, case studies

 Ability to deal with unique trial designs

 Single-arm, open-label
 - Cross-over, stacked therapy,
 - Adaptive designs
- Shortened development cycles
 - Availability of Tx prior to ph3 completion
 - Fewer patients exposed, limited data elements and endpoints for approval and reimbursement submissions
- Applying companion diagnostics
 - Consideration for cost of screening and pt. identification
 - Addition of new testing platforms multiplexing or multiple marker tests

Retrospective analysis of never-smokers with lung adenocarcinoma of all stages 100 **ALK-negative patients** 90 ALK-positive patients p=0.0134 Percent survival 80 70 60 50 40 Λ 3 5 Years since diagnosis Yang et al . Journal of Thoracic Oncology 2012;7 (1):90-97 Retrospective case-matched survival analysis of ALKpositive patients who did not receive crizotinib 100 WT/WT Control (n=125) % 80 ALK Positive (n=23) % 60 HR = 1.42, p=0.18 % 40 % 20% 0% 2 3 1 0

XALKORI: Example of Personalized Medicine in Action

Efficient Development

- Time from discovery to approval exemplifies Pfizer's new approach and commitment to drug development
- FDA's approval of Xalkori marks the first new lung cancer drug approval in 6 years

<u>Well Defined Patient Population with Improved Efficacy</u>

- 3%-5% of advanced NSCLC patients who test positive for the anaplastic lymphoma kinase (*ALK*) re-arrangement are eligible to receive therapy
- ALK⁺ NSCLC patients who were treated with XALKORI had significantly improved PFS compared to SOC therapy¹

Efficient Healthcare Spending

 Unnecessary costs may be avoided as therapy is prescribed only to selected patients more likely to respond

 $^1\,{\rm PROFILE}$ 1007 Phase 3 study top line report , Pfizer Press Release, June 19, 2012

Still Work to Do: An Evolving Process

- How best to gather a substantial body of evidence to satisfy regulators and payors?
- Incorporation of molecular profiling into "usual" care of cancer patients
- Synchronization of the timing between:
 - Drug development
 - Biomarker discovery
 - Development of companion diagnostic
- Future diagnostic practice: single tests vs. multiple marker tests for specific cancers

How Far Have We Come in 40 Years Since the Declaration of the "War on Cancer"?

Then

Now

Understanding of Cancer Genetic disease Tumor-focused; uncontrolled cell proliferation **Detection & Prevention** Physical examination; limited Sophisticated screening and greater understanding of the importance understanding of the disease entity; of early detection Increasing use of molecular testing **Treatment Options** Surgery, radiation, chemotherapy **Targeted therapies**

As Science Advances, Oncology Drug Development Accelerates

Pharma & Diagnostic Companies Harness the Potential of Personalized Medicine

Early Development

Research

Development

Commercial

Legal

Regulatory

- Genomics data drives decision making
- DX assay, protocol, patient selection tools
- IP strategy
- Phase I plan to measure marker
- Proof of mechanism strategy
- Commercially viable CDx concept
- External partner agreement

- Validated assay
- Proof of concept trial design with CDx

Ph₃

- Commercial viability of label
- Payor research
- Reimbursement and Access Strategy
- Partner commercialization agreement

 Define label requirements for CDx

Registration/

Launch

- Commercialization strategy
- Engage with medical experts
- Communications strategy for CDx and therapy
- Reimbursement submissions

Success Depends on an Integrated and Collaborative Process

Summary

- Personalized medicine is about delivering the right treatment, to the right patient, at the right time
- Innovation and incremental efficiencies may be facilitated as additional biomarkers are identified, greater synergies and partnerships are established between pharmaceutical and diagnostic developers, and increased numbers of patients are swiftly diagnosed and treated
- There is a need for newer thinking and methodological approaches to the development of **supportive regulatory and reimbursement evidence** within this new paradigm of drug development
- Personalized Medicine benefits multiple stakeholders and supports the efficient use of healthcare resources by concentrating efforts on patients most likely to benefit and sparing expense and side effects for those who will not
- Alignment of incentives for personalized medicine among all stakeholders is critical to support the highest degree of clinical innovation that will improve health outcomes, health care delivery and ultimately, improve the quality of life of patients
